

RSC showcases research @ Goa University

Royal Society of Chemistry (RSC), with a dual role of learned society and professional association of over 50000 members, spread over the world, specializing in all branches of Chemistry publishes 46 very high and high impact factor journals as a part of their objective. One of their journal titled '*Dalton Transactions*' with an impact factor of 4.099 and receiving over 67000 citations in the last year to its articles has showcased the work on [precursor derived tungsten sulfides](#), with a focus on their micro- and local structures on the cover page of the journal issue. The paper is co-authored by a faculty from Goa University along with others from Kiel University, Germany. While researchers dream of publishing in the RSC journals, showcasing the work on the cover page is an added prestige to the work. Congratulations to all those involved in this important research.

The University researches are deposited in the [Goa University repository](#) and interested readers desiring to know more may send requests for reprints for a paper of interest.
